

EXECUTIVE MEMO | COLLECTIONS RECOVERY

Decision: Do not accept “11% month-on-month improvement” as a sustained collection-effectiveness KPI.

What happened

Feb→Mar clean recovery increased 11.03% (Fact). Payer accounts increased 11.32%, while recovery per payer decreased 0.26% (Strong Evidence). The movement is not sustained through July.

Why

500 payment IDs are duplicated; ₹2.59 Cr duplicate SUCCESS value is removed. Event-level borrower IDs conflict with account identity. Agent IDs are historically unstable. 12,422 RPC-like dispositions sit on non-ANSWERED calls. Mixed timezones and late-arriving history add reporting risk.

Confidence

High for payment-ledger reconstruction; medium for controlled operational conversion metrics; low for causal targeting/channel lift because historical targeting is observational and strategy versions overlap.

Recommendation

Invest ₹10 Cr in Better Borrower Targeting, released through a randomized holdout / stepped-wedge experiment. Primary KPI: incremental 14/30-day recovery per eligible account, with complaint and contact-burden guardrails.

Financial case

Annualized Jan-Jul clean recovery = ₹217.45 Cr. Break-even lift = 4.60%. At 5% lift: ₹10.87 Cr incremental recovery, 1.09x gross benefit/cost, 8.7% net ROI.

Immediate controls

Use account_id as event spine; deduplicate payment_id; preserve source timezone; create effective-dated agent/vendor mappings; add cost data; monitor recovery, payer counts, attribution coverage and DQ anomalies.
